

# North Carolina Society of Gastroenterology 2024 Annual Meeting

## BACK TO THE FUTURE OF GI ENDOSCOPY: ARTIFICIAL INTELLIGENCE, THE NEXT FRONTIER?

Jeremy R. Glissen Brown MD, MSc  
Assistant Professor of Medicine  
Duke University Medical Center

Joint Providership

American Society for  
Gastrointestinal Endoscopy

# Disclosures

- Consultant for Medtronic
- Consultant for Olympus

# Learning Objectives

- Summarize advances in artificial intelligence in the field of endoscopy and how they can be applied to current clinical practice

# Why is This Important?

**Annals of Internal Medicine**  
**Real-Time Use of Artificial Intelligence in Identification of Diverticulosis During Colonoscopy**  
**A Prospective Cohort Study**  
 Yuichi Mori, MD, Kinichi Hotta, MD, Yasuhiro Maeda, Takemasa Hayata, Masahiro Oda, PhD  
**Background:** Colonoscopy may help prevent colorectal cancer by identifying and resecting diverticulosis.  
**Objective:** To evaluate the accuracy of real-time use of artificial intelligence (AI) systems for diverticulosis detection during colonoscopy.  
**Design:** Single-center, prospective cohort study.  
**Setting:** University hospital.  
**Participants:** 79 patients with diverticulosis.  
**Intervention:** Real-time use of AI systems for diverticulosis detection.  
**Measurements and Main Results:** The AI system had a sensitivity of 92.0% and specificity of 91.3% for diverticulosis detection. The AI system was able to detect diverticulosis in real time during colonoscopy, which is a critical finding for preventing colorectal cancer. The AI system was able to detect diverticulosis in real time during colonoscopy, which is a critical finding for preventing colorectal cancer.

**ORIGINAL RESEARCH**  
**Deep Neural Network Accurately Predicts Prognosis of Ulcerative Colitis Using Endoscopic Images**  
 Kento Takenaka,<sup>1</sup> Kazuo Ohtsuka,<sup>2</sup> Toshimitsu Fujii,<sup>1</sup> Shiori Oshima,<sup>3</sup> Ryuichi Okamoto,<sup>1</sup> and Mamoru Watanabe<sup>4</sup>  
<sup>1</sup>Department of Gastroenterology and Hepatology, Tokyo Medical and Dental University, Tokyo, Japan; <sup>2</sup>Endoscopic Unit, Tokyo Medical and Dental University Hospital, Tokyo, Japan; <sup>3</sup>Medical Imaging Development Department, Medical Business Group, Sanyo Imaging Products & Solutions Inc, Kanagawa, Japan; and <sup>4</sup>TMDU Advanced Research Institute, Tokyo Medical and Dental University, Tokyo, Japan  
**Keywords:** Mucosal Healing; Artificial Intelligence; IBD; Diagnostic; Prognostic.  
**Background:** Although mucosal healing is considered a critical treatment goal in ulcerative colitis (UC), an endoscopy-based approach has limitations. First, the interpretation is subjective and based on individual experience.<sup>1</sup> Second, histologic remission is another treatment goal,<sup>2</sup> but a mucosal specimen is required.  
**Objective:** We previously developed a deep neural network system based on endoscopic images of UC (DNUC). Results showed that the accuracy of the DNUC and endoscopists was comparable. The DNUC could predict histologic remission without a mucosal biopsy specimen. However, no data from a cross-sectional study are available on the predictive value of the DNUC. In this follow-up study, we evaluated whether the DNUC could predict patient prognosis.  
**Methods:** From April 2018 to April 2019, consecutive patients with UC were enrolled, as in the previous study.<sup>1</sup> The Tokyo Medical and Dental University Ethics Committee approved the present study.  
**Results:** The study enrolled 875 patients. The clinical characteristics of the participants and mucosal findings are summarized in Supplementary Table 1. A total of 93 patients received additional treatment (prednisolone/immunomodulatory/biologics) within 1 month after colonoscopy, and all patients exhibited mucosal activity. After a median follow-up of 20 months, 79 patients were hospitalized, 25 underwent colectomy, 150 needed steroid therapy, and 133, who were in clinical remission, had a clinical relapse.  
**Conclusion:** We evaluated the relationship between the DNUC output and the end points. The Kaplan-Meier curve analysis indicated that mucosal healing was associated with a significantly lower risk of worse prognosis ( $P < .001$  for hospitalization, colectomy, steroid use, and clinical relapse; Figure 1A-D). The subanalysis revealed that endoscopic and histologic activities were risk factors of poor prognosis (Supplementary Figure 1).  
**Conclusion:** By comparing the findings obtained using the DNUC with those obtained by the experts, we found that the DNUC had a high sensitivity (92.0%) and specificity (91.3%) for evaluating mucosal healing, and its positive and negative predictive values were 86.2% and 95.1%, respectively.  
**Methods:** From April 2018 to April 2019, consecutive patients with UC were enrolled, as in the previous study.<sup>1</sup> The Tokyo Medical and Dental University Ethics Committee approved the present study.

# Common Terminology in AI Research

**Artificial Intelligence:** computer systems that can perform tasks that normally require ‘human intelligence’. Examples: visual perception, speech recognition, natural language processing, self-driving cars

**Machine learning:** A set of computational methods that involves using mathematical models to learn to make decisions and outline patterns from data. Examples: Linear regression, boosted trees, random forests, support vector machines

**Deep learning:** A subset of machine learning that relies on multi-layered neural networks to extract information from multiple feature inputs to learn from complex inputs

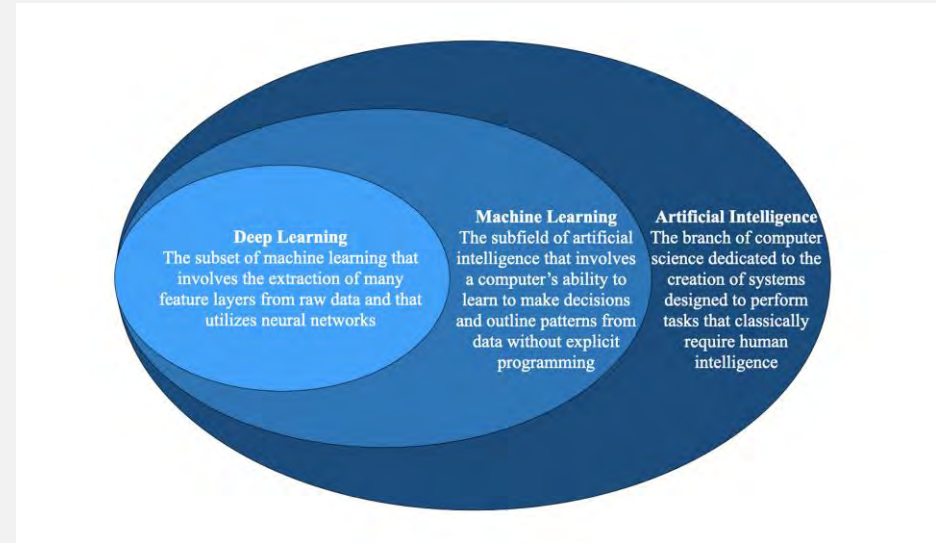

**Computer vision:** technology that allows computers to “see” and interpret visual content (photos, video)

# Common Terminology in AI Research

**Large Language Model:** Models that process vast amounts of text data (usually scraped from the internet)

- Usually transformer architecture
- "Generative." Take an input text → predict the next word/token
- Adaptable

# Why Now? (2012-Present)

- Tremendous growth in computational power
- Availability of big data
- Advanced machine learning algorithms

Figure 12.2 Deep network architecture with multiple layers.

# Applications

Computer-aided detection (CADe)

Predictive Modeling

Computer-aided diagnosis (CADx)

## Endoscopic Quality Assessment

S. Thakkar

## AI assisted reporting/analytics

## Ambient Clinical Intelligence

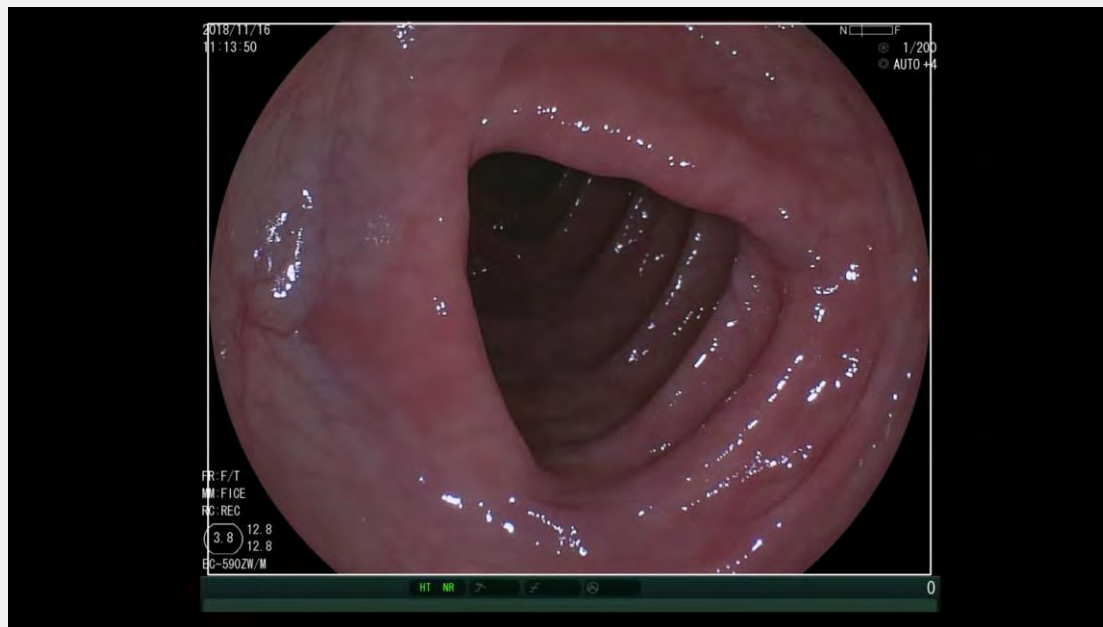

# Computer Aided Detection

- The most 'advanced' application of AI
- Several FDA approved CADe systems in the U.S.
- Near-real time delineation of polyps during colonoscopy

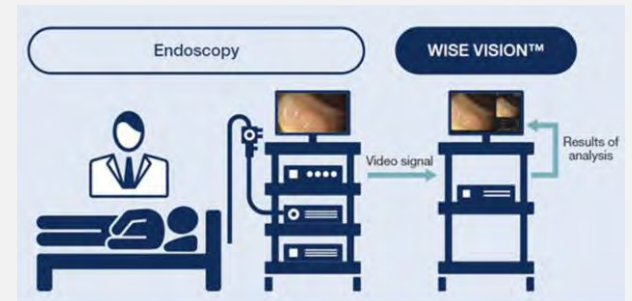

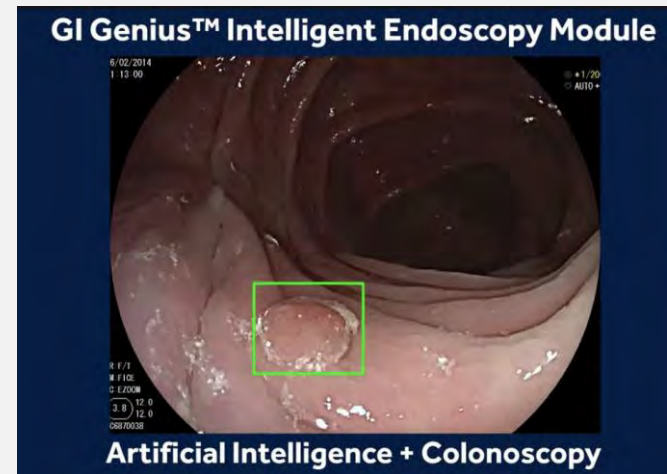

Repici et al. Gastroenterology 5/3/20; 512-520.E7

Glissen Brown et al. VideoGIE. 4/2020; P135-137

# Computer Aided Detection

- Endoscreener Wision, AI, Shanghai, China and Micro-Tech Endoscopy, Ann Arbor, MI
- Magentiq-Colo, Magentiq EYE LTD, Haifa, Israel
- SKOUT, Iterative Health, Cambridge MA USA and Provation, Minneapolis, MN
- More pending

# The Evidence

## Efficacy of Real-Time Computer-Aided Detection of Colorectal Neoplasia in a Randomized Trial

Alessandro Repici,<sup>1</sup> Matteo Badalamenti,<sup>1</sup> Roberta Maselli,<sup>1</sup> Loredana Correale,<sup>1</sup> Franco Radaelli,<sup>2</sup> Emanuele Rondonotti,<sup>2</sup> Elisa Ferrara,<sup>1</sup> Marco Spadaccini,<sup>1</sup> Asma Alkandari,<sup>3</sup> Alessandro Fugazza,<sup>1</sup> Andrea Anderloni,<sup>1</sup> Piera Alessia Galtieri,<sup>1</sup> Gaia Pellegatta,<sup>1</sup> Silvia Carrara,<sup>1</sup> Milena Di Leo,<sup>1</sup> Vincenzo Craviotto,<sup>1</sup> Laura Lamonaca,<sup>1</sup> Roberto Lorenzetti,<sup>4</sup> Alida Andrealli,<sup>2</sup> Giulio Antonelli,<sup>4</sup> Michael Wallace,<sup>5</sup> Prateek Sharma,<sup>6</sup> Thomas Rosch,<sup>7</sup> and Cesare Hassan<sup>4</sup>

- 685 patients undergoing screening, surveillance, or diagnostic colonoscopy across 3 endoscopy centers in Italy
- Patients randomized 1:1 to receive HDWL colonoscopy or AI-assisted colonoscopy (single screen)
- Significant increase in ADR (54.8% vs 40.4%) with a relative risk of 1.30 (95% CI, 1.14–1.45)
- Higher APC
- No significant difference in withdrawal time or resection for FPs

Repici et al. Gastroenterology. 5/2020; 512-520.E7

## META-ANALYSIS

### Effect of computer-aided colonoscopy on adenoma miss rates and polyp detection: A systematic review and meta-analysis

Sagar Shah,\* Nathan Park,<sup>†</sup> Nabil El Hage Chehade,<sup>‡</sup> Anastasia Chahine,<sup>†</sup> Marc Monachese,<sup>†</sup> Amelie Tiritilli,<sup>†</sup> Zain Moosvi,<sup>§</sup> Ronald Ortizo<sup>†</sup> and Jason Samarasena<sup>†</sup> 

\*Department of Internal Medicine, University of California Los Angeles Ronald Reagan Medical Center, Los Angeles, <sup>†</sup>H. H. Chao Comprehensive Digestive Disease Center, University of California Irvine Medical Center, Orange, California, <sup>‡</sup>Division of Internal Medicine, Case Western Reserve University MetroHealth Medical Center, Cleveland, Ohio, and <sup>§</sup>Division of Gastroenterology, Hepatology and Nutrition, University of Pittsburgh, Pittsburgh, Pennsylvania, USA

- Meta-analysis of 14 RCTs containing 10,928 patients
- 52% increase in ADR in CADe vs. control (OR, 1.52; 95% CI, 1.39–1.67, P = 0.04, I<sup>2</sup> = 47%).
- 65% reduction in AMR (OR, 0.35; 95% CI, 0.25–0.49, P < 0.001, I<sup>2</sup> = 50%)
- 93% increase adenomas > 10 mm de- tected (OR 1.93; 95% CI, 1.18–3.16, P < 0.01, I<sup>2</sup> = 0%).
- Decrease in SSLMR

Shah et al. Journal of Gastroenterology & Hepatology 11/9/2022 Nov 9.

# Tips and Tricks

**Figure 2.** An example of a single monitor setup, where computer-aided detection output is displayed on the primary endoscopy screen. (Image ©2020 Medtronic. All rights reserved. Used with the permission of Medtronic.)

# Tips and Tricks

## Using Computer-Aided Polyp Detection During Colonoscopy

Mohammad Bilal, MD<sup>1</sup>, Jeremy R. Glissen Brown, MD<sup>1</sup> and Tyler M. Berzin, MD, FASGE, FACG<sup>1</sup>

*Am J Gastroenterol* 2020;115:963–966. <https://doi.org/10.14309/ajg.0000000000000646>; published online May 13, 2020

- Mucosal inspection techniques paramount
- Toggle on during withdrawal after cleaning
- Limit bubbles, suction polyps
- Toggle on during tool deployment but off during intervention

Bilal et al. *Am J Gastroenterol* 7/2020; 115(7):963-966.

# Tips and Tricks

Optimal use of CADe during colonoscopy

Glissen Brown et al. VideoGIE. 4/2020; P135-137

# Questions and Controversies in CADe

- Hold outs and delayed uptake
- Question of de-skilling and CAdE in the training curriculum
- Lack of benefit in some trials (see above)
- Task specific "AI" sows doubt
- Cost

### Colonoscopy Procedure Report

**PROCEDURE PERFORMED :** Colonoscopy  
**LAST COLONOSCOPY PERFORMED :** 4/22/2011  
**INDICATION FOR EXAMINATION:** Surveillance.  
 Last Colonoscopy was performed on :4/22/2011 (> 10 Years).

**PROCEDURE TECHNIQUE:** A physical exam was performed. Informed consent was obtained from the patient after explaining all the risks (perforation, bleeding, infection and adverse effects to the medicine), benefits and alternatives to the procedure which the patient appeared to understand and so stated. The patient was connected to the monitoring devices and placed in the left lateral position. Continuous oxygen was provided with a nasal cannula and IV medicine administered through a indwelling cannula. After adequate conscious sedation was achieved, the patient was intubated and the scope advanced under direct visualization to the Cecum.

The scope was subsequently removed slowly while carefully examining the color, texture, anatomy, and integrity of the mucosa on the way out. The patient was subsequently transferred to the recovery area in satisfactory condition.

The following findings were noted:

EXTENT OF EXAM:	VISUALIZED	PHOTO DOCUMENTED
Cecum	Yes	Yes

**BOSTON BOWEL PREP SCORE :TOTAL SCORE 9**  
**RIGHT COLON : 3 TRANSVERSE COLON : 3 LEFT COLON : 3**  
**QUALITY OF BOWEL PREP :** Adequate

**WITHDRAWAL TIME:** 00:06

**POLYPECTOMY PERFORMED :** 1  
**POLYPS RETRIEVED:** 1

**CEGALINTUBATION:**Yes    **COMPLETENESS:**Yes    **RETROFLEXION:**Yes  
**UNPLANNED EVENTS:**

**2** Normal

**3** Diverticulosis

**4** Diverticulosis

**5** Flat Polyp

# Generative AI And Foundation Models

Figure. Artificial Intelligence (AI) 1.0, 2.0, and 3.0

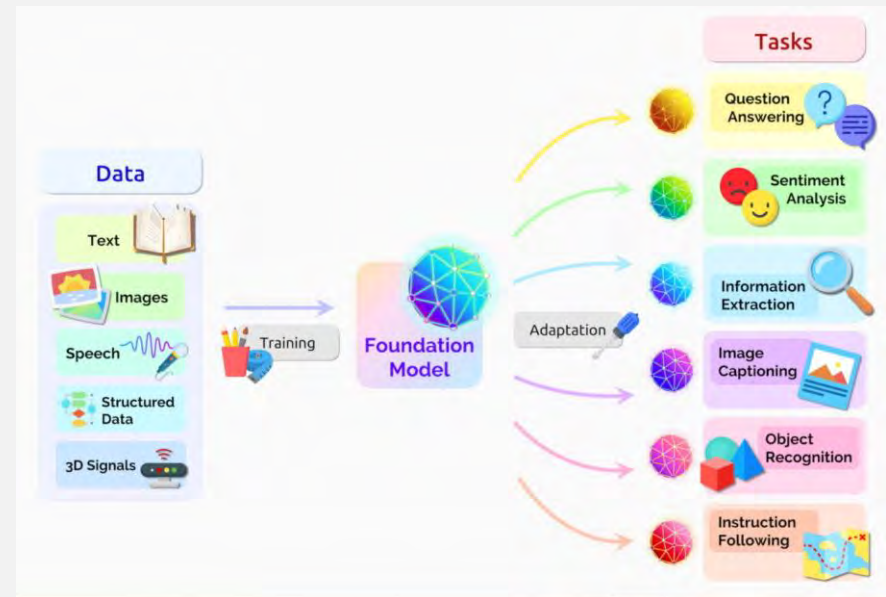

Approximate beginning year	1950s	2011	2018-2022
	AI 1.0 Symbolic AI and probabilistic models	AI 2.0 Deep learning	AI 3.0 Foundation models
Core functionality and key features	Follows directly encoded rules (if-then rules or decision trees)	Predicts and/or classifies information Task-specific (1 task at a time); requires new data and retraining to perform new tasks	Generates new content (text, sound, images) Performs different types of tasks without new data or retraining; prompt creates new model behaviors
Training method	Rules based on expert knowledge are hand-encoded in traditional programming	Learning patterns based on examples labeled as ground truth	Self-supervised learning from large datasets to predict the next word or sentence in a sequence
Performance capabilities	Follows decision path encoded in its rules. <i>Eg, ask a series of questions to determine whether a picture is a cat or a dog.</i>	Classifies information based on training: <i>"Is this a cat or a dog?"</i> <i>"How many dogs will be in the park at noon?"</i>	Interprets and responds to complex questions: <i>"Explain the difference between a cat and a dog."</i>
Examples of performance	IBM's Deep Blue beat the world champion in chess Health care: Rule-based clinical decision support tools	Photo searching without manual tagging, voice recognition, language translation Health care: diabetic retinopathy detection, breast cancer and lung cancer screening, skin condition classification, predictions based on electronic health records	Writing assistants in word processors, software coding assistants, chatbots Health care: Med-PaLM and Med-PaLM-2, medically tuned large language models, PubMedGPT, BioGPT
Examples of challenges and risks	Human logic errors and bias in encoded rules lead to limited capability with real-world situations	Out-of-distribution problems (real-time data differs from training data) Catastrophic forgetting (not remembering early parts of a long sequence of text) Bias related to underlying training data	Hallucinations (plausible but incorrect responses based solely on predictions) Grounding and attribution Bias related to underlying training data and semantics of language in datasets

Howell et al JAMA 2024 Jan 16;331(3):242-244.

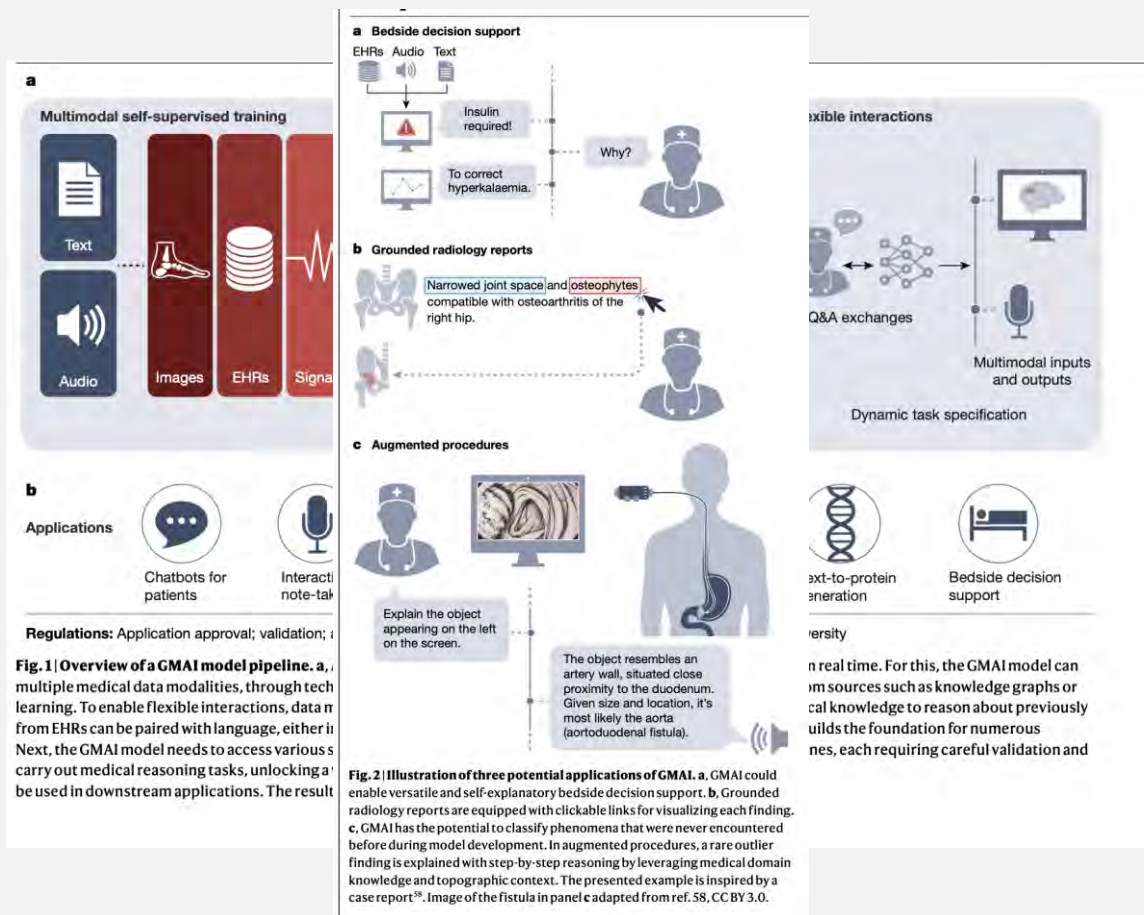

# Generative AI And Foundation Models

- Foundation models:
  - Eg ChatGPT, DALL-E2
  - Neural networks (eg transformer architecture)
  - Unsupervised learning
  - Broad, flexible outputs, generative

## CME/MOC Question:

Best Practices for CADe include all of the following except:

- a. Toggling the device off during insertion and cleaning and on during a “clean” withdrawal
- b. Toggling device on during intervention
- c. Toggling the device off during intervention
- d. Limiting bubbles and suction polyps during withdrawal

Joint Providership

American Society for  
Gastrointestinal Endoscopy

## CME/MOC Answer:

Best Practices for CADe include all of the following except:

- a. Toggling the device off during insertion and cleaning and on during a “clean” withdrawal
- b. Toggling device on during intervention**
- c. Toggling the device off during intervention
- d. Limiting bubbles and suction polyps during withdrawal

Joint Providership

American Society for  
Gastrointestinal Endoscopy

# Take Home Points

- ❑ CADe is a solved problem in colonoscopy and multiple algorithms are FDA approved for clinical use
- ❑ Best practices are evolving but include careful insufflation and cleaning prior to use, toggling on during withdrawal and off during intervention
- ❑ Explosion in growth of other deep learning applications. CADe is only the beginning

Thank you!
